Flood Situation Report - 2001

(Based on the reports received from concerned Departments/State Govts.)

Impact of Southwest Monsoon - 2001:

- “ Several parts of the Country receive heavy rainfall during the South West Monsoon resulting in floods, landslide, loss of human life and cattle, disruption of all communication network, damages to houses and property and dislocation of normal activities.
- “ During the last season of Southwest monsoon, many parts of the country witnessed heavy floods / rains and thousands of human life and cattle lost. The flash floods in Himachal Pradesh, Arunachal Pradesh, Andhra Pradesh, UP, Bihar, West Bengal etc. took hundreds of human lives and caused immense damage to properties during 2000.
- “ Keeping in view the past experience during June-September during the Southwest monsoon, States/UTs and concerned Central Government Departments/ Ministries were requested to take necessary precautionary/preventive measures and advance planning to combat any serious situation.

IMD's forecast & report:

- “ India Meteorological Department (IMD) has Stated that there was good pre-monsoon rainfall activity over most parts of the Country during this year. The cumulative rainfall for the period March 1, 2001 to May 31, 2001 has been normal to excess over 27 meteorological subdivisions of the country.
- “ IMD's long range official forecasts for the rainfall during 2001-Southwest monsoon season are as follows:

a) In 2001, the rainfall for the Southwest monsoon (June to September) for the country as a whole is likely to be normal, thus making the year 2001 the 13th normal monsoon year in succession. The normal is defined as rainfall within + 10% of its long period average.

b) Quantitatively, the rainfall over the country during the season is likely to be 98% of its long period average with an estimated model error of + 4%.

c) Over the three broad homogenous regions of India, the rainfall for the season is likely to be 100% of its long period average (LPA) over Northwest India, 96% of the LPA over the Peninsula and 100% of the LPA over Northeast India with an estimated model error of + 8%.

IMD's Weekly Weather Report (for the week ending July 11, 2001):

“ A well-marked low-pressure area formed over Northwest and adjoining central Bay of Bengal of Orissa and Andhra Pradesh coast persisted on 5 & 6th July. It eventually merged with the monsoon trough on 12th. Fairly widespread rainfall occurred in western and central parts of India in association with the above low-pressure area. Some parts of north Peninsula also received good rainfall.

“ During the week ending on 11th July 2001, the rainfall was Excess in Orissa, Punjab, Himachal Pradesh, Jammu & Kashmir, West Rajasthan, East Rajasthan, East Madhya Pradesh & Chhattisgarh, Gujarat region, Daman, Dadra & Nagar Haveli, Saurashtra, Kutch & Diu, Konkan & Goa, Madhya Maharashtra, Vidarbha, Coastal Andhra Pradesh, Coastal Karnataka, Kerala, Lakshadweep, and Normal in Nagaland, Manipur, Mizoram & Tripura, Gangetic West Bengal, West Madhya Pradesh, Telengana, North Interior Karnataka, South Interior Karnataka.

“ During the period from June 1 to July 11, 2001, 28 out of 35 meteorological subdivisions covering 75% districts and 85% area of the country received normal to excess rainfall. Country as a whole received 19% above normal rainfall so far.

“ The outlook for the week ending July 18, 2001 indicates that the rainfall activity is expected to remain subdued over major parts of the country during earlier part of the week. It will be enhanced over the foothills of the Himalayas and northern plain. The activity is expected to revive over central parts of the country towards later half of the week.
