

2-5. Internet-based information sharing

2-5-1. ADRC's Website

As shown in Fig. 2-5-1-1, ADRC's website (URL <http://www.adrc.or.jp/>) consists of the following items of disaster related data: Latest Disaster Information, Multi-lingual Glossary on Natural Disasters, Disaster Information Database, Conference, Disaster Related Resources –Publications, Studies, Disaster Information from Member Countries, ADRC Highlights, Disaster Reports from Member Countries, ADRRN (Asian Disaster Reduction and Response Network), Archives, the Great Hanshin-Awaji Earthquake Database, and Center Information.

There are also pages introducing U.N. International Strategies for Disaster Reduction. Moreover, GLIDENumber.net (URL <http://glidnumber.net/>), a disaster information generation and retrieval site using GLIDE (GLobal unique disaster IDentifier number) has been in operation since May 2004.

The screenshot shows the ADRC website homepage. At the top, there is a header with the ADRC logo and name, and navigation links for 'Glossary on Natural disasters', 'Site Map', and 'Japanese'. Below the header is a large banner image showing a group of people. Underneath the banner is a horizontal menu with buttons for 'ADRC TOP', 'About ADRC', 'Activities', 'The latest Disaster Information', 'Disaster Related Information to Member Countries', 'The latest Events', and 'The latest Publications'. The main content area is divided into several sections: 'The latest Events' (listing a conference on 25 June 2007), 'Past events', 'The latest Publications' (listing reports on 15 April 2005), 'Past publications', 'Latest Disaster Information' (listing a 7.5 magnitude quake on 22 January 2008 and a landslide on 15 January 2008), 'Online Resources' (including GLIDE number and Disaster Management Support System), 'Reports on ADRC Projects' (including Tsunami Awareness Questionnaire Survey, Natural Disasters Data Book - 2006, Inamura no Hi, TDRM Good Practices, and ACDR 2007), and 'Partners' (including ISDR and IRP).

Fig.2-5-1-1 ADRC HP Menu

In this year, the existing ADRC's web site was improved to retrieve the data for the user's demand, and strengthened to incorporate into more contents. On the "Top Page", the Latest Disaster Information was listed as a main topics, and also the both "GLIDE" and "Disaster Management Support System" project were introduced as on-line resources, and the useful linkage was connected to the disaster related organization such as UN/ISDR and IRP etc. And other main pages such as "Activity of ADRC", "About Us", "Latest Disaster Information" was also listed on the "Top Page" as useful tags as shown on Fig. 2-5-1-2.

The screenshot displays the ADRC website interface. At the top, there is a header with the ADRC logo and navigation links for 'Glossary on Natural disasters', 'Site Map', and 'Japanese'. Below the header is a banner image showing people working at a table. A navigation bar contains buttons for 'ADRC TOP', 'About ADRC', 'Activities', 'The latest Disaster Information', 'Disaster Related Information for Member Countries', 'The latest Events', and 'The latest Publications'. The 'Activities' section is highlighted, and the breadcrumb trail reads 'TOP PAGE >> Information Sharing on Disaster Reduction >> Activities'. The main content area is titled 'Information Sharing on Disaster Reduction' and contains two sub-sections:

(1) Provision of Information on the Latest Disasters, Disaster Preparedness of Member Countries, and Good Practices

ADRC provides information on the latest disasters in Asia and the other part of the world, disaster management in member countries, and good practices for disaster risk reduction. A multilingual glossary of natural disasters is available in English, French, Spanish, Chinese, Korean, and Japanese on its website.

(2) Promotion of GLIDE (Global unique disaster IDentifier)

ADRC proposed a globally common, unique identification scheme for disaster events, as a tool for facilitating the sharing of disaster information archived by organizations around the world. The idea was launched as the new initiative, "GLIDE", jointly with such organizations as the OCHA.

Fig.2-5-1-2 ADRC's Activity

As shown by Fig. 2-5-1-3, these disaster reduction-related data are stored in their corresponding databases. When there is an access request from the Internet, the information is retrieved from the corresponding database and sent to the user in a hypertext format based on instructions on display coloring and layouts. Separate storage of the content data in the database from the layout instruction data frees administrators of complicated layout settings and allows easy layout change in batches to keep pace with user needs and technological innovation. This way of database management makes it possible to provide users with two ways of information access (by content or by country) as well as a directory that further facilitates access.

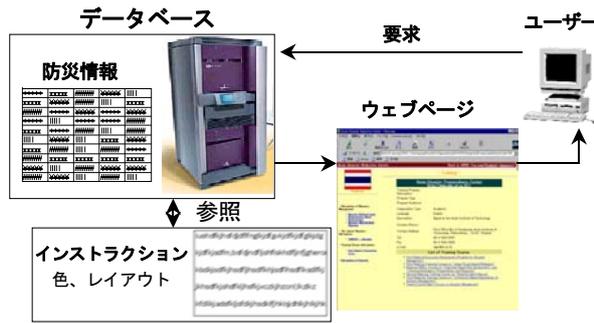

Fig.2-5-1-3 Linked Database-driven Website

As shown in Fig. 2-5-1-3, these data are managed into two tables, classified respectively by disaster event and by report. In response to a request from a user, these tables are used to extract the relevant data from the database and create a report according to the layout instructions.

Remote updating is performed over the Internet as shown in Fig. 2-5-1-4. Since the previous year, it has become possible to update information via the Web pages except for some functions. This allows delivery of more accurate information and faster updating of information.

The latest disaster information is collected and recorded by full-time and part-time ADRC staff to minimize the time lag from when a disaster occurs until the relevant information is made available. On December 26, 2004, when a massive earthquake hit the Sumatra region in Indonesia and a huge Tsunami swept the Indian Ocean, this ADRC site had 100,000 access requests per hour via the direct link on Yahoo News Portal.

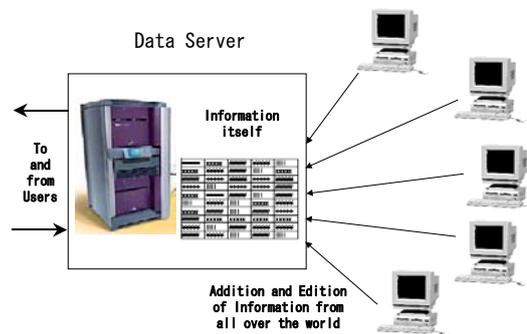

Fig.2-5-1-4 Remote Updating over Window Layout

2-5-2. Latest Disaster Information Database

When a natural disaster occurs, information on the extent of the damage, the situation of the affected area, and emergency response & relief is collected and disseminated by the mass media, local and central governments, international organizations, NGOs, etc. However, most of the information is provided individually and it takes time to get all the necessary information.

The ADRC developed a database and started to publish the latest disaster information webpage in order to contribute as a clearinghouse of disaster information from various sources in September 1998. Summarized information with direct links to the original information sources has been provided on the pages for rapid search and retrieval of information.

Fig.2-5-2 Latest Disaster Information

In particular, the database provides a brief summary of disasters (dates, locations, and overviews), brief outlines of damage situations, link information categorized by reports/articles, geographic data, emergency relief information, urgent reports from supporting members of the ADRC, and graphic information. In addition, the database connected to the link to the other site "JAXA DMSS" to enhance the value to the ADRC's web site using the satellite image data taken at the affected site after the natural disaster when the emergency satellite observation was conducted.

The database provides information of more than 600 disasters in the world as of the end of March 2008.

2-5-3. ADRC Newsletter: ADRC Highlights

The ADRC has been using the Internet and e-mail to share information with its counterparts in member countries, and with other interested parties. As one of its mainstay tools for information dissemination, the ADRC has been issuing the twice-a-monthly newsletter "ADRC Highlights" since 1 June 1999. This newsletter is made publicly available on the Web. It is also e-mailed in English, Russian and Japanese to ADRC's counterparts, participants in the past ADRC annual meetings, ADRC personnel at home and abroad, visitors to the ADRC, and participants in international conferences the ADRC has taken part in. The numbers of subscribers in Japanese, English and Russian have increased to 818, 2162 and 168, respectively as of 1 March 2008.

The contents include articles on the latest ADRC activities, reports on international conferences, and other events which ADRC staff attended and gave presentations in, as well as national reports by ADRC visiting researchers from member countries.

In order to keep good ties with participants of ADRC's training courses and relevant officials in Japan and overseas, this communication tool has been very effective. In addition, the ADRC receives responses to the newsletter immediately after it is e-mailed. The newsletter has been a very useful tool for information sharing.

2-5-4. Multilanguage Glossary on Disaster Reduction

A multilanguage glossary on disaster reduction (Japanese, English, Spanish, French and Chinese) was compiled through the activities of the United Nation's IDNDR launched in 1990. To make the glossary available for a wider range of individuals, the ADRC has been providing online translation services in languages other than Chinese.

With the addition of the Korean language to the existing 5-language glossary, the Korean and Chinese glossary databases was completed in 2002.

Thus, a 6-language glossary is now available on the ADRC website. All the Korean terms in the database were checked by Dr. Dugkeun Park, a senior analyst of the National Institute for Disaster Prevention of the Ministry of Government Administration and Home Affairs, the counterpart organization of South Korea, an ADRC member country.

The glossary contains about 3,200 terms - mainly disaster-related terms that are hard to find in ordinary dictionaries - and has been facilitating sharing of information related to disaster reduction and management, such as numerical data, technical materials and study reports.
